

The goal

BIONEXT S.A. is a Biotechnology company created in April 2009 to provide cutting-edge and creative bioinformatics and cheminformatics solutions to achieve comprehensive molecule **structure and reactivity studies**, even in cellular context.

The unique ability of BIONEXT to perform high quality **virtual screening of molecular regions** allows to revolutionize some aspects of the drug development.

Context and needs

Ever-lasting and recurring issues even reinforced by current headline news

Time development

*A virus can mutate and become dangerous in a few months while developing an active treatment may take **more than 15 years***

Lack of efficacy

*The efficacy of a compound not only depend of its affinity with its wished target, but also of its **affinity with other targets** in the cell*

BIONEXT solutions helps dramatically decrease development time and increase efficacy of compounds

Application areas

Fundamental
Research

To better understand molecular mechanisms and system biology

Industrial
Research

To identify and characterize molecular targets and compounds

Toxicology

To identify and characterize some of the molecular causes of toxicity

MSVM: solution for Molecular Structure Visualization and Mapping

Much more than a simple visualization software, **MSVM*** has been designed to improve the understanding of molecular functions and mechanisms. This unique **research platform** is the core of BIONEXT solutions and provides **simple, fast and accurate** answers to today's complex questions.

MSVM Molecular Cartography

(*) MSVM works on
Windows, OSX, Linux

Special features:

- Photo-realistic visualisations
- Precise moves with 3D Mouse ()
- Molecular types differentiation
- Several surface representations
- Slideshow for large dataset study
- Direct access to Uniprot and PDB

Optional modules:

- Detection of structural fingerprints
- Molecular interaction analysis
- Molecular Cartography
- Comparison of molecular regions
- Virtual Screening (see BVS)

« As better visualization also means better understanding »

BVS: BIONEXT Virtual Screening

The **BVS module** allows to analyze and compare more precisely the molecular structures by defining **true molecular regions** of variable physico-chemical properties, shapes and sizes. BIONEXT has demonstrated that even two completely different molecules can share a same function if they share a same functional region.

Example of regions to screen:

The BIONEXT **CRYSTAL** database contains 90 million molecular regions generated from the 60,000 available molecular structures. BIONEXT Screening Databases can be easily built to **work on specific organisms and/or tissues**.

BVS application examples and benefits

1 To identify the molecules that share a particular region

Different molecules having the same region

2 To functionally characterize a molecule

Different binding sites and new partners

1 BVS unit

- CRYSTAL
- Uniprot
- PDB

3 To detect specific regions

Some specific regions

4 To identify molecular targets of compound

Some molecular targets

Two patents deposited July, 2009
